Advantys STB
Distributed I/O Solution
Open and Modular System

Presentation

To meet the needs of machine manufacturers and users, automation architectures have been decentralized while delivering performance comparable to centralized systems. The Advantys STB distributed I/O system, an open, modular input/output system, makes it possible to design islands of automation managed by a master controller via a bus or communication network.

These islands, installed as close to the machine as possible, help reduce the time and cable costs for sensors and actuators, while increasing system availability.

The island components are electronic modules mounted on one or more DIN rails. These clusters of modules, known as segments, carry a bus from beginning to end of each island. The island bus provides power distribution, signal sensing, and power management to all compatible modules, in the form of a wiring management system.
The sensors and actuators on the I/O modules are connected to the I/O modules via removable screw- or spring-type connectors. Built-in mechanisms make it possible to remove and replace (hot swap) Advantys STB modules when the system is powered on.

The Advantys STB distributed I/O system features a protection rating of IP 20. For installations in production workshops, the Advantys STB distributed I/O system must be incorporated in protective housings with at least an IP 54 rating (in compliance with IEC 60950 or NEMA 250 standards). See page 55.

Each Advantys STB module has a default configuration making the island operational as soon as it is powered on. However, in order to benefit from the various module features, use the Advantys configuration software to configure the system to meet user requirements. This software also allows you to define reflex actions in the output modules, thereby avoiding processing by the island master (see pages 42 to 45.

Composition

A typical Advantys STB island is composed in great part of I/O modules of various widths: 13.9, 18.4 and 28.1 mm. The I/O modules, used in conjunction with the DIN rail, network interface modules "NIM" and power distribution modules "PDM", as well as other accessories, convey a bus which distributes various required power supplies to each module:

An island including 1 to 7 segments comprises:
■ 1 STB N●● Network Interface Module "NIM".
This module manages communications on the island bus. It acts as a gateway for exchanges with the fieldbus or network master. Seven network protocols are offered: Ethernet TCP/IP, CANopen, Modbus Plus, Fipio, INTERBUS, Profibus DP, and DeviceNet.
■ 1 or more STB PDT Power Distribution Modules "PDM". They provide the ⎓ 24 V or ∿ 115/230 V field power required for the sensors and actuators, thereby simplifying connections.
■ Digital I/O modules with DC power (STB DD) or AC power (STB DA).
■ Analog I/O modules using current or voltage: STB A●●.
■ STB EHC counter modules.
■ Application-specific modules for controlling TeSys d model motor-starters (mounted with the Tego Power system) and STB EPI TeSys model U starter-controllers.

Additional modules are available for the various architectures proposed below (see page 5):
■ 2 STB XBE 1●00 "EOS" and "BOS" extension modules for multisegment structures (up to 6 extension segments).
■ STB XCA bus extension cables.
■ 1 STB XBE 2100 CANopen extension module for integrating standard CANopen devices.

Ⓣ **Telemecanique**

Description

### Advantys STB: primary segment

In the example above, the primary segment comprises:

1 STB N●●: Network Interface Module "NIM". It is placed at the beginning of the primary segment. Each island must have one NIM module only.
2 STB PDT 2100: Power Distribution Module "PDM". It is installed immediately to the right of the NIM and provides ∿ 115/230 V power to the I/O modules requiring AC power.
3 STB DA● : digital I/O modules with AC power.
4 STB PDT 3100: Power Distribution Module "PDM". It is installed after all the ∿ 115/230 V I/O modules. It provides ⎓ 24 V to the I/O modules requiring DC power.
5 STB AV● and STB AC●: analog I/O modules requiring DC power. They are installed after the "PDM" module.
6 STB XMP 1100: bus termination.

Advantys STB: primary segment with extension segments

max. 15 m with max. 32 I/O modules

The island bus can support the primary segment with as many as six extension segments.

These segments comprise:

1 STB N●●: Network Interface Module "NIM". It is placed at the beginning of the primary segment. Each island must have one NIM module only.
2 STB PDT ●100: PDM power distribution module (⎓ 24 V or ∿ 115/230 V). It is installed immediately to the right of the NIM and provides ⎓ 24 V or ∿ 115/230 V power according to the type of I/O modules located on the right.
3 STB AV●, STB AC●, STB DD●, STB DA● and STB DR●: Analog and digital I/O modules, requiring AC or DC power. The I/O groups of various powers are placed to the immediate right of the PDM matching their type.
4 STB XBE 1000: EOS bus extension module: It is always installed in the rightmost position in the primary or extension segment, and is used to extend the island bus to another segment.
5 STB XBE 1200: BOS bus extension module. It is installed at the beginning of each extension segment.
6 STB XMP 1100: island bus termination.
7 STB XCA 100●: island bus extension cables.

Description (continued)

Advantys STB with application-specific modules, preferred module, and standard CANopen devices

1 2   3 4 5   6 7 13   8   13 9 2 4 5 10 14   11   12

max. 6.50 m with max. 15 I/O modules *(1)*
The island bus can support:

■ Preferred modules of type ATV 38/58 controller (available later). This type of preferred module is installed between two segments.
■ Standard CANopen devices. They are installed at the end of the island with up to 12 standard CANopen devices. These devices may reduce the maximum island length to 6.5 m (baud rate dependant).

The island bus comprises:

1 STB N●●: Network Interface Module "NIM".
2 STB PDT 3100: ⎓ 24 V Power Distribution Module "PDM". It is installed immediately to the right of the "NIM" and provides ⎓ 24 V power to the I/O modules requiring DC power.
3 STB EHC 3020: 1 channel counter module.
4 STB EPI 1145: module for Tego Power motor-starters.
5 STB AV● and STB AC●: analog I/O modules
6 STB EPI 2145: module for TeSys model U starter-controllers.
7 STB XBE 1000: EOS bus extension module: It is always installed in the slot the farthest to the right in the primary or extension segment, and is used to extend the island bus to another segment.
8 ATV 58 controller: preferred module with special option card (available at a later date).
9 STB XBE 1200: EOS bus extension module. It is installed at the beginning of the extension segment.
10 STB XBE 2100: CANopen extension module (max. 12 devices per island).
11 FTB 1CN: Advantys FTB IP 67 monobloc I/O splitter boxes.
12 FTX DPTL12: CANopen bus line terminator (with 120 Ω resistance).
13 STB XCA 100●: island bus extension cables.
14 User supplied cable.

(1) Includes the preferred modules and the standard CANopen devices.

Presentation

The STB N●● 2212 network interface modules, located at the beginning of each island, are gateways for exchanging data between the network or bus master PLC and the Advantys STB automation island.

They also enable (except Economy CANopen NIM module) the configuration of parameters and addressing of installation devices. These settings are stored in the module's internal RAM or Flash memory. Optionally, they can be saved to the STB XMP 4440 removable memory card (32 Kb).
1 Fieldbus master
2 External ⎓ 24 V power supply
3 HMI terminal
4 Network Interface Module "NIM"
5 Power Distribution Module "PDM"
6 I/O modules
7 Other network nodes
8 Other slave PLCs
9 Bus terminator

The Advantys STB offer comprises 8 network interface modules, each one dedicated to a specific network or bus:

Network or bus	Network interface module
Ethernet network	STB NIP 2212
CANopen Bus	STB NCO 2212, STB NCO 1113
Modbus Plus Network	STB NMP 2212
Fipio Bus	STB NFP 2212
INTERBUS Bus	STB NIB 2212
Profibus DP Bus	STB NDP 2212
DeviceNet Network	STB NDN 2212

Power Supply for Network Interface Module

Network interface modules are powered by an external ⎓ 24 V power supply. They convert this power to ⎓ 5 V to provide logic power to the Advantys STB I/O modules. Logic power for the I/O modules in each extension segment is provided by that segment's "BOS" STB XBE 1200 module. See page 5.

This built-in 5 V power supply provides up to 1.2 A current.

Telemecanique
Description

Network interface modules (except for the INTERBUS STB NIB 2212 module)

They feature the following on the front panel:

1 A connector used to connect the island to the fieldbus. See the various connector types on page 9.
2 Two rotary node addressing selectors on the bus or the network.
3 An external ⎓ 24 V power connector for the removable screw-type (STB XTS 1120) or spring-type (STB XTS 2120) connector.
4 A display block with LEDs for the various island states on the bus: power, communication, send/receive data, errors, etc.
5 Locking screw for the STB N●● 2212 module of DIN rails.
6 A drawer *(1)* for an STB XMP 4440 removable memory card.
7 Cover *(1)* accessing the port used to connect an island setup and configuration PC or an HMI screen (read/write data), and the Reset button.

INTERBUS STB NIB 2212 network interface module

It is identical to the network interface modules described above except for the INTERBUS connector.

It features the following on the front panel:

1 A 9-pin SUB-D male connector used to connect the input bus cable.
2 A 9-pin SUB-D female connector used to connect the output bus cable.
3 An external ⎓ 24 V power connector for the removable screw-type (STB XTS 1120) or spring-type (STB XTS 2120) connector.
4 A display block with LEDs for the various island states on the bus: power, communication, send/receive data, errors, etc.
5 Locking screw for the STB N●● 2212 module of DIN rails.
6 A drawer *(1)* for an STB XMP 4440 removable memory card.
7 Cover *(1)* accessing the port used to connect an island setup and configuration PC or an HMI screen (read/write data), and the Reset button.

Network interface modules are provided with the STB XMP 1100 bus terminator and are mounted directly on DIN rails.

(1) Not available with STB NCO 1113 Economy CANopen module.

(1) Use a $=$ 24 V SELV external power supply (Safety Extra Low Voltage).
(2) Max. 126 STB modules for all islands with the STB NCO 1113 Economy CANopen module

Special features of the STB NCO 1113 Economy CANopen NIM

The Economy CANopen NIM (STB NCO 1113) allows the bus master to view any I/O module following the STB NCO 1113 as an individual device. Its configuration and setup are performed by exporting the EDS file to the island master configuration software.

The I/O modules that depend on the STB NCO 1113 module are integrated in the PL7/Unity network configuration software and directly exchange data over the fieldbus. As a result, the custom configuration of the I/O modules (using the Advantys configuration software) and the use of reflex functions are not available with the Economy CANopen Interface network module.

Advantys STB
Distributed I/O Solution
Power Distribution Modules
Presentation

The STB PDT ●100 Power Distribution Modules "PDM" provide power for the I/O module sensors and actuators via the sensor bus **1** and the actuator bus **2**.
Two power distribution modules are available for the Advantys STB distributed I/O:
■ The STB PDT 3100 module is dedicated to providing power to the I/O module sensors and actuators requiring a ⎓ 24 V power supply
■ The STB PDT 2100 module is dedicated to providing power to the I/O module sensors and actuators requiring a ⎓ 115/230 V power supply.

Choice of Power Distribution Module "PDT" determined by I/O modules

Power distribution module	Voltage (V)	STB I/O modules

Description

The Advantys STB PDT ●100 power distribution modules comprise:
1 A location for a customizable label.
2 A status block with 2 display LEDs:
  IN LED on: the sensor bus power supply is present,
  OUT LED on: the actuator bus power supply is present.
3 A color-coded module identification stripe (red for ∼ 115/230 V, blue for ⎓ 24 V).
4 A connector for removable screw-type connector (STB XTS 1130) or spring-type connector (STB XTS 2130) used to connect the sensor power supply.
5 A connector for removable screw-type connector (STB XTS 1130) or spring-type connector (STB XTS 2130) used to connect the actuator power supply.

To be ordered separately:

6 A STB XBA 2200 mounting base, width 18.4 mm.
  This base features:
7 A location for a customizable label.
8 A captive grounding screw.

Characteristics

Module Type			STB PDT 3100	STB PDT 2100
Power supply voltage		V	⎓ 24 *(1)*	∼ 115/230
Max. current	For inputs	A	4 at 30 °C 2.5 at 60 °C	5 at 30 °C 2.5 at 60 °C
	For outputs	A	8 at 30 °C 5 at 60 °C	10 at 30 °C 5 at 60 °C
Sensor/actuator bus voltage range		V	⎓ 19.2...30 *(2)*	∼ 85...265 *(3)*
Plug in/plug out with power on			No	
Nominal consumption		mA	0 on ⎓ 5 V logic power supply	
Reverse polarity protection			Yes, on the actuator bus	
Built-in overcurrent protection	For inputs		By 5 A time-delayed fuse	
	For outputs		By 10 A time-delayed fuse	
Max. current on the grounding terminal		A	30 for 2 minutes	
Voltage-detect thresholds	IN/OUT LED turns on		⩾ ⎓ 15 V ± 1 V	> ∼ 70 V ± 5 V
	IN/OUT LED turns off		< ⎓ 15 V ± 1 V	< ∼ 50 V ± 5 V
Mounting base			STB XBA 2200 width 18.4 mm	

(1) Use a ⎓ 24 V external power supply with very low safe allowable voltage.
(2) DC power supplies may be shared or separate, or shared with the ⎓ 24 V SELV power supply of the network interface module.
(3) AC power supplies for a given distribution module from a three-phase transformer must be connected at the same phase.

Presentation

The STB digital input/output modules consist of input modules, output modules, and relay output modules.

The digital I/O offering is defined as follows:

■ 5 digital input modules:
□ one 2-channel module, one 4-channel module, and one 6-channel module with 24 VDC voltage,
□ one 2-channel module with 115 VAC voltage,
□ one 2-channel module with 230 VAC voltage.

■ 5 digital output modules:
□ two 2-channel modules, one 4-channel module, and one 6-channel module with 24 VDC voltage,
□ one 2-channel module with 115/230 VAC voltage.

■ 2 relay output modules:
□ one 2 form C relay outputs,
□ one 2 form A/B relay outputs.

Description

A typical digital input/output module comprises the following:

1 A location for user-customizable label.

2 A display block showing:
□ the state of the module (RDY, ERR),
□ the state of channel (IN● or OUT●).

3 A color-coded module identification stripe.

4 Two receptacles for field-wiring connectors.

To be ordered separately:

■ I/O bases width 13.9, 18.4 or 28.1 mm, depending on the model of I/O module STB XBA 1000/2000/3000.These bases feature a location for the user-customizable label.

■ Removable screw terminal (5 or 6-channel) STB XTS 1110/1100 or removable spring terminal (5 or 6-channel) STB XTS 2110/2100.

■ Mechanical keying pin to insert between:
□ the I/O module and this I/O base: STB XMP 7700,
□ the field wiring connector and this I/O module: STB XMP 7800,
to ensure that the I/O module, I/O base and field wiring connector are properly matched.

■ User-customizable labels sheets: STB XMP 6700.

Distributed I/O Solution
Analog Input/Output Modules

Presentation

The STB analog inputs allow the acquisition of various analog values encountered in industrial applications.The STB analog outputs are used to control analog field devices such as variable speed drives, proportional control values, etc.

The analog I/O offering is defined as follows:

■ 3 analog input modules:
□ one with 2 ± 10 V, single-ended analog input channels,
□ one with 2 0…20 mA, single-ended analog input channels,
□ one with 2 thermocouple, "RTD" or mV channels.

■ 2 analog output modules:
□ one with 2 single-ended analog output channels configurable for 0…10 V or ± 10 V,
□ one with 2 single-ended analog current output channels at 0…20 mA.

Description

A typical analog input/output module comprises of the following:

1 A location for user-customizable label.

2 A display block showing:
□ the state of the module (RDY, ERR),

3 A color-coded module identification stripe.

4 Two receptacles for field-wiring connectors.

To be ordered separately:

■ I/O bases width 13.9 mm STB XBA 1000. The base features a location for the user-customizable label.

■ Removable screw terminal (6-point) STB XTS 1100 or removable spring terminal (6-point) STB XTS 2100.

■ Mechanical keying pin to insert between:
□ the I/O module and this I/O base: STB XMP 7700,
□ the field wiring connector and this I/O module: STB XMP 7800,
to ensure that the I/O module, I/O base and field wiring connector are properly matched.

■ User-customizable labels sheets: STB XMP 6700.

Parallel Interface for Tego Power Applications
1 63 A power splitter box
2 Control splitter box
3 Connection cable
4 Connection control module
Presentation

The STB EPI 1145 parallel interface is a component of the Advantys STB island designed for the remote connection of 8 motor-starters (or 4 motor-starters in both directions). These TeSys model d motor-starters use the Tego Power installation assistance system.

The Tego Power System

Tego Power is a modular system to help install TeSys model d motor-starters by offering prewired control and power circuits. This Quickfit technology enables cable-free connections to spring-loaded contactor terminals, model d (9 to 32 A) and GV2 M2 motor circuit-breakers.

Tego Power with Quickfit technology enables you to create motor-starter assemblies up to 15 kW/400 V.

Structure of the Tego Power System

The Tego Power system differentiates the power section from the control section:

■ The power kit comprises:
□ a specific plate used to assemble 2 to 8 motor-starters,
□ two connection modules,
□ a power splitter box with a power terminal block,
The contactor for each motor-starter is activated by one of the 8 outputs of the STB EPI 1145 parallel interface.
■ The control kit comprises:
□ a control splitter box for the 2 to 8 motor-starters,
□ a connection module.
The 2 return outputs of each motor-starter (contactor status, circuit-breaker status) are connected to 2 of the 16 inputs to the STB EPI 1145 parallel interface.

Description

The STB EPI 1145 parallel interface comprises:
1 A display block with 8 LEDs indicating the state of the various motor-starters or output devices.
2 A location for a user-customizable label.
3 A color-coded module identification stripe (black).
4 Selection switch used to view each motor-starter state.
**5** An HE 10 connector (30-pin) to connect to a Tego Power system via STB XCA 3002/3003 cables.

To be ordered separately:
An STB XBA 2000 base, width 18.4 mm. The base features a location for the user-customizable label.

Advantys STB
Distributed I/O Solution
Parallel Interface for TeSys Model U
Applications

Presentation

The STB EPI 2145 **1** parallel interface is a component of the Advantys STB distributed I/O system designed for the remote connection of 4 TeSys model U starter-controllers (12 inputs and 8 outputs).

Presentation of model U starter-controllers

The TeSys model U starter-controllers is a direct motor-starter which performs the following functions:
■ Protects and controls single phase or 3-phase motors:
□ disconnecting power,
□ short circuit and overcurrent protection,
□ thermal overload protection,
□ power switching,
■ Application control:
□ protection alarms, application monitoring (amount of time in use, number of faults, motor current values, etc.).
□ history.

Components of a model U starter combined with an STB EPI 2145 *(1)* module

The starter-controller functions are performed by a click-lock adjustment that removes the need for cables,
■ On a power base **2**.
■ a ⎓ 24 V **3** control unit (LUC B/D/C/M ●●BL) for 0.09 to 15 kW motors.
■ a parallel link communication module (LUF C00) **4**.
■ options (additional contacts, inverter blocks) **5**

Each of the 4 channels of the STB EPI 2145 application-specific module features:
■ 2 outputs (starter control and reverse direction control).
■ 3 inputs (circuit-breaker status, contactor status, and direction feedback).

(1) TeSys model U components: consult our catalog "Starters and basic TeSys model U equipment".

Description

The STB EPI 2145 parallel interface module comprises:
1 A display block with LEDs for the various states of the starter-controllers.
2 A location for a user-customizable label.
3 A color-coded module identification stripe (black).
4 4 RJ45 connectors for connecting 4 model U starter-controllers.

To be ordered separately:
An STB XBA 3000 base, width 28.1 mm.
The base features a location for the user-customizable label.

Advantys STB
Distributed I/O Solution
Counter Module

Presentation

Counting parts or events, grouping objects, controlling incoming and outgoing data streams, and measuring lengths or positions all require counting functions.
The STB EHC 3020 counter module performs these functions for an Advantys STB automation island (controlled by a master connected to the island) with a max. counting frequency of 40 kHz.
The STB EHC 3020 module, with 1 counting channel, accepts as input typical $=$ 24 V sensors: proximity sensors, photo-electric detectors, incremental encoders or mechanical contacts *(1)*.
As output, the module features 2 digital $=$ 24 V 0.5 A outputs.
The Advantys configuration software is used to select one of the six functions the module can perform.
(1) The counting frequency is limited to 400 Hz with mecanical contacts.

Description

The front panel of the STB EHC 3020 counter module features:
1 A display block with 8 display LEDs:
□ RDY LED: module is operational,
□ FLT LED: steady: module fault; blinking: $=$ 24 V power distribution fault or output short circuit (depending on pattern)
□ OUT 1 or OUT 2 LEDs: output 1 or 2 active (steady) or short circuit (blinking),
□ IN A, IN B, RST and EN LEDs: status of 4 input channels.

2 Location for user-customizable labels.
3 Color-coded module identification stripe (black).
4 A connector for an STB XTS 2150 removable spring-type connector (must be ordered separately).

To be ordered separately:
■ STB XBA 3000 base width 28.1 mm. Includes a location for user-customizable labels.
■ STB XTS 2150 removable connector with 18-pin.

Operation
Counter channel block diagram
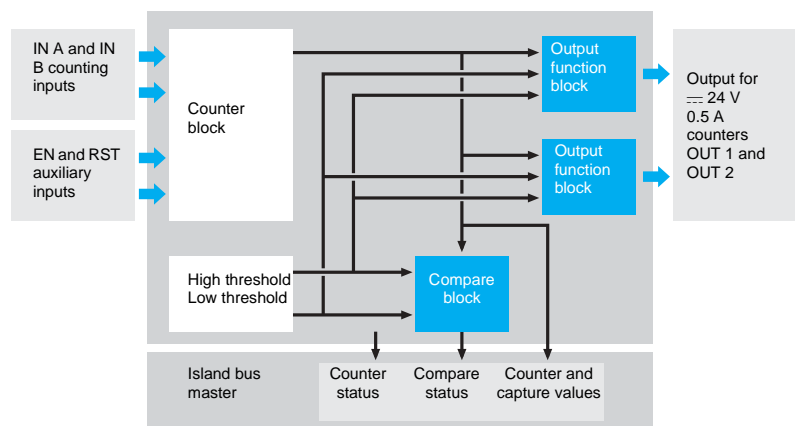

Depending on the counting function used (see operating characteristics page 39), the I/O for the STB EHC 3020 module are allocated to:
■ Input IN A, connected to a sensor.
■ Inputs IN B, EN and RST, connected to a sensor or activated by the Advantys STB master via the field bus.
The 16-bit counter value is continually compared to the two threshold values (configured with the configuration software) and is used to activate the two OUT 1 and OUT 2 outputs, without requiring processing by the bus master controller.
Reports such as the counting value or the two status bits (counter status, compare status) are sent to the master controller of bus.

Telemecanique

Functional characteristics

Configurable functions	Number	1 of the 6 configurable functions (using the Advantys configuration software)
	Frequency meter	This function measures the frequency received on the IN A input. This frequency is always expressed in Hz (number of pulses per second), with a precision of 1 hertz. Also measures the speed in Units per second. The number of points to be received on the IN A input, corresponding to one unit, must be defined from one up to 255. The maximal frequency on the IN A input is 40 kHz in both cases (without filtering). Response time: < 0,2 s (frequency 2/40 kHz), < 1 s (frequency 0,2 kHz).
	Count events	This function provides the value of the number of pulses received on the IN A input during a selectable time unit. The time unit is configurable : 0.1s, 1s, 10 s or 1 minute. The IN B input can be used to reset the internal time basis which provides the time unit. The maximal number of pulses counted during a time unit is up to 65535. The minimal pulses duration on the IN A input is 10 µs (without filtering). Response time: < 0,5 ms
	Measure time periods	Measures the elapsed time during an event or between two evens (on IN A input) according to the selectable time base of 10 µs, 100 µs or 1 ms. The max. event duration is 0.655, 6.55, or 65.5 seconds, respectively. The max. frequency on the IN A input is 200 Hz. Response time: < 0.5 ms.
	Down counting	The IN B input starts or restarts the counter by resetting the setpoint value defined by the high threshold value. When the counter is running , any pulse received on the IN A input decreases the counter. The counter stops when it reaches 0. The setpoint maximal value is 65535. The maximal frequency on the IN A input is 40 kHz (without filtering). Response time : < 0,5 ms
	Loop (modulo) counting	The IN B input starts or restarts the counter by resetting the setpoint value to 0. The IN B input also triggers the capture of the previous counting value before the counter is reset to 0. When the counter is running , any pulse received on the IN A input increases the counter. The counter turns back to zero automatically when the pulse number received equals the modulo defined by the high threshold value. The modulo maximal value is 65535. The maximal frequency on the IN A input is 40 kHz (without filtering). Response time : < 0,5 ms
	Up/down counting	The RST input starts or restarts the counter by resetting the preset value. When the counter is running, the counting increases or decreseases according to the pulses received on the IN A and IN B inputs (default settings : IN A increases the counter and IN B decreases the counter). By configuration: □ the IN B input can define the counting direction of the pulses received on IN A. □ the IN A and IN B inputs can receivet the signals of an incremental encoder. The counter value is limited to 0 as low limit and to 65535 as high limit. Response time : < 0,5 ms
	OUT 1 and OUT 2 output functions	According to requirements, each of the counting module's two outputs can be configured for one of the following operating modes: □ No direct action: the counter status and status words are processed by the island master □ The output is activated when the counter value is less than the low threshold □ The output is activated when the counter value is between the low threshold and the high threshold □ The output is activated when the counter value is greater than the high threshold □ A pulse is generated on the output when the low threshold is exceeded (when counting down) □ A pulse is generated on the output when the low threshold is exceeded (when counting up) □ A pulse is generated on the output when the high threshold is exceeded (when counting down) □ A pulse is generated on the output when the high threshold is exceeded (when counting up) □ The output is activated as long as the counter is RUN (only available on downcouting function) □ The output is activated when the counter is STOP □ The output is activated when the capture value is less than the low threshold (only available on modulo function) □ The output is activated (according to the modulo) when the counter value is between the low threshold and the high threshold

Characteristics

Electrical characteristics

Module Type			STB EHC 3020	
Frequency on counting inputs		kHz	1 channel max. 40	
Hot swapping supported			Yes	
Mounting base			STB XBA 3000	
PDM Power distribution module required	Voltage provided	V	24	
	Reference		STB PDT 3100	
Consumption on the logic bus	⎓ 5 V	mA	60 typical, 140 max.	
Isolation	Between island bus and I/O	⎓ V	500	

Characteristics of Inputs

Input type			Counting inputs (IN A and IN B)	Auxiliary inputs (EN and RST)
Nominal values	Voltage	⎓ V	24 (limits 19.2…30 V)	
	Current	mA	6	
Limit values	At state 1		⎓ 11…30 V, min. 2 mA current (at ⎓ 11 V)	
	At state 0		⎓ - 3…5 V, max. 1.5 mA current	
Logic			Positive	
Filter time	Analog	µs	2.5	25
	Digital	ms	None (max. count 40 kHz) 0.40 (max. count 1 kHz) 1.20 (max. count 400 kHz)	–

Characteristics of Outputs

Output type			OUT 1 and OUT 2 outputs
Rated power voltage		⎓ V	24 (limits 19.2…30 V)
Nominal current		A	0.5 (1 A per module)
Logic			Positive (by default), positive on 1 or 2 channels, negative on 1 or 2 channels (configurable)
Response Time			See functional characteristics, page 39
Leakage current	At state 0	mA	max. 0.1
Voltage drop	At state 1	V	max. 3
Max. load inductance		Henry	0.5 at 4 Hz, or $L = 0.5/I^2 \times F$ where L: load inductance, I: load-in current, and F: switching frequency
Short circuit and overload protection	Type per channel		By current limiter (1.1 A typical/1.5 A max.) and electronic tripping (manual or automatic reset)
Default fallback positions	Default		Set to 0 state for both channels
	Configured		Maintain at value, set to state 0 or 1 for each channel

Advantys STB
Distributed I/O Solution
Configuration Software

Presentation

The configuration process of the Advantys STB system includes the following steps:
■ If necessary, configure all the I/O modules for Advantys STB (digital, analog, and application-specific), and the modules with a default configuration.
■ Configure the reflex functions handled at the island level.
These settings are defined using the STB SPU 1000 dedicated Advantys configuration software. This program also allows to:
■ Optimize island performance by giving a priority assignment to processing for certain modules.
■ Assign mandatory modules (modules whose presence and correct operation are required for the island to operate correctly).
■ Declare in the island standard CANopen devices or preferred devices (such as the ATV 38/58 controller available later).
■ Check the configuration for compliance and power consumption.
■ Modify the module's default features.

User Interface

The main screen of the Advantys STB configuration software gives access to all the available tools in an ergonomic, easy-to-use fashion.
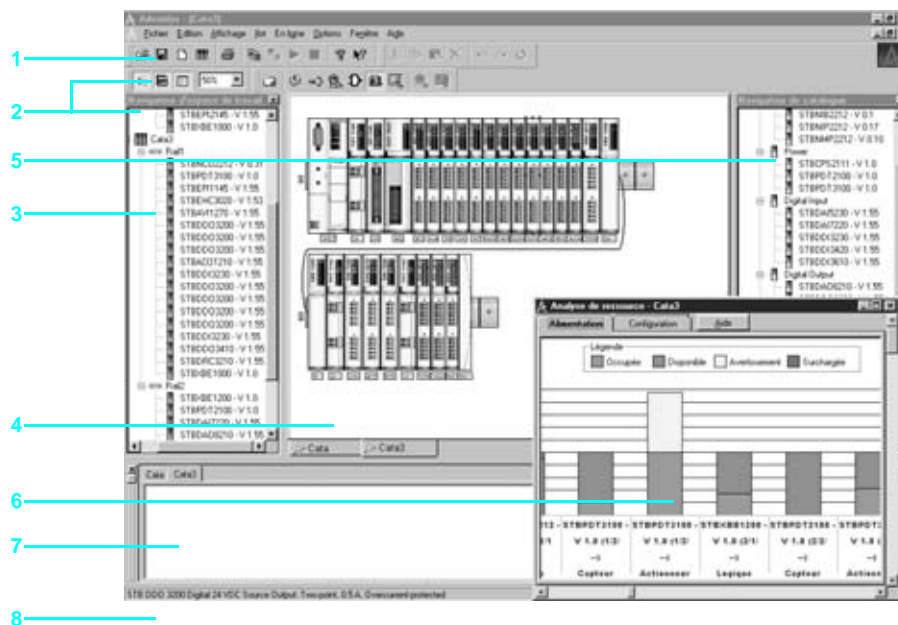

This main screen contains a general view comprising several windows and toolbars that can be moved about the screen.
1 Menu bar, giving access to all functions.
2 Toolbar containing icons used for direct access to editors and the most frequently used functions.
3 Application browser, for browsing the various islands and segments of each island.
4 Main window for viewing islands and segments. By selecting a module, you can access the following editors:
☐ Module Editor,
☐ Reflex Action Editor,
☐ Power supply and memory resource analysis,
☐ Overview of the I/O image,
☐ Diagnostics.
The last two items are available only if the island is online.
5 Catalog browser for all the Advantys STB components, sorted by category (networks, power supply, digital I/O, etc.).
6 Power supply and memory resource analysis window.
7 Log window displaying the results of operations performed by the configuration software during a work session on an island.
8 Status bar.

Functions
Module Editor

The number of tabs provided by the editor is determined by the mode in which you execute the Advantys Configuration Software (Local or Online). The editor displays some or all of the following tabs: General, etc.

"General" Tab

This read-only tab (island online or offline), provides general information and displays the key technical characteristics of the selected module.

"Properties" Tab

This tab, accessible when the island is offline, contains the operating settings for the selected module, some of which can be changed by the user. Among other things, you can:

■ Select the display format for parameters: decimal or hexadecimal.

■ Identify a module as "mandatory". That module is then designated as critical for island operations. If the module fails or is not present, the island will no longer be operational (it will stop).

■ Declare the scanning priority for the digital input modules. This allows you to assign more frequent scanning to up to 10 modules per island, so that they will be considered as "fast" modules.

■ Configure the module. The configurable items (cells with white backgrounds) depend on the type of I/O module. Depending on the type of module, the main parameters are:
□ user label assignment: free text field, max. 50 characters,
□ digital input modules: filter time and choice of positive or negative logic for each channel,
□ digital output modules, the behavior upon short circuit or overload (manual or automatic reset), the choice of positive or negative logic for each channel, the default fallback position for each channel (0 or 1 state).
□ analog input modules, with the offset and scaling for each channel,
□ the analog output modules, with for each channel, the refresh rate and the default fallback position (maintain the value or assume a predefined value),
□ parallel interfaces for Tego Power and TeSys Model U applications, the choice of positive or negative logic for each channel, the behavior upon short circuit or overload (manual or automatic reset), and the default fallback position for each channel (0 or 1 state).
□ counter module, the definition of the counting function and its operation, see page 38,
□ network interface modules, the amount of memory reserved for data exchanges with the Operator Terminal (directly connected to the network interface module).This data is also accessible by the island's master device. If an Advantys STB island has a CANopen extension, a parameter allows you to define the address of the last standard CANopen device connected to the island.

Online help for the selected module can be displayed to show the limits and operating values of these parameters.

Functions (continued)

"I/O Image" Tab

This tab, accessible when the island is online, provides a table with data concerning the:
■ Input/Output modules comprising the Advantys STB island (values and state of each module).
■ Operator Terminal connected to the network interface module. The length of this field (defined in the "Properties" tab of the network interface module) equals the maximum total size of the image table, less the words occupied by the image of the I/O modules.

The total size of the I/O image table depends on the type of the network interface module. These I/O images can be displayed in two views:
■ Field bus or network view: each protocol transfers its data in a specific format.
■ Internal island bus view: the Modbus protocol is used.

"Diagnostics" Tab

This tab allows the user to perform diagnostics for the island connected to the PC terminal where the Advantys Configuration Software resides.
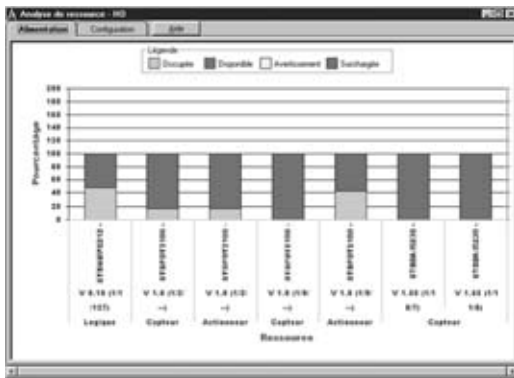

Analysis of the island's memory and power resources

At any time during the configuration process, you can consult the following information as a percentage:

■ The power consumption at various voltages:
□ 5 V logic provided by the STB N● network interface module,
□ 24 V provided by the STB PDT 3100 power distribution module(s),
□ 115/230 V provided by the STB PDT 2100 power distribution module(s),

■ The usage of the memory integrated in the network interface module:
□ image field for inputs and outputs,
□ settings field for the island configuration data and reflex functions,
□ field dedicated to operator dialog.

Downloading Configuration Data

The software enables bi-directional transfer of configuration data:

■ From the PC to the RAM and Flash memory of the island interface module in order to make the island operational. If the network interface module includes the STB XMP 4440 32 KB removable memory card, data is written to the card, providing a backup.
■ From the NIM interface module to the PC.

Importing/Exporting EDS files

When the island includes standard CANopen devices, you must use the software to import the description of those devices contained in the EDS files into the catalog database.
Inversely, those descriptions may be exported to the master in case of a CANopen, INTERBUS or DeviceNet bus.

Printing

The Printing mode allows you to select the islands and topics to be printed. You can also print to a file in PDF or RTF format.

Telemecanique
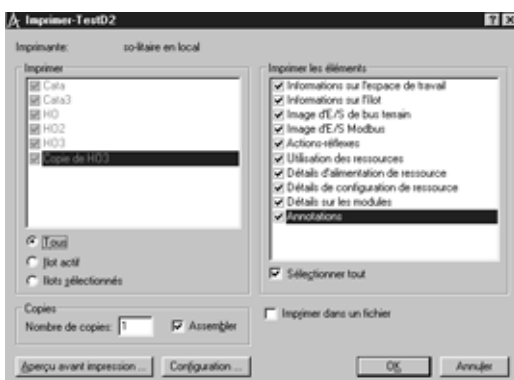

Advantys STB
Distributed I/O Solution
Configuration Software

Functions (continued)
Reflex Editor

For applications requiring short response times (< 3 ms), the Advantys Configuration Software allows you to create reflex functions that work directly on the island output modules, thereby freeing the bus master from parsing and process them. These reflex functions can be associated with "priority" I/O modules to ensure the reliability of the response time.

An Advantys STB island can call up to 10 reflex functions. These functions are created from blocks whose inputs are activated by the digital or analog input channels and whose results activate an analog or digital output channel. You can nest two reflex functions.

Reflex types and function blocks

Various types of function blocks are available:

Boolean logic function blocks:
XOR block, AND block with 2 inputs and 3 outputs
Timer/monostable blocks: when working, when idle, upon activation, and upon deactivation
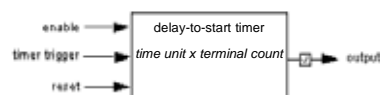

Rising/Falling Edge counting function blocks:
on rising or falling edge, from 0 to 65,535
Compare function blocks on signed integers
(- 32,768 to 32,767): $i <$, $i >$, $< i >$, $i <$ and $i >$
Digital Latch function blocks: on state 0 or 1 or on rising or falling edge, memorize state 0 or 1

Analog Latch function blocks: on state 0 or 1 or on rising or falling edge, memorize the signed integer (0 to 65,535) or unsigned integer (-32,768 to 32,767)
References

The multilingual Advantys Configuration Software is compatible with the following operating systems: Windows 98 (second edition SE), Windows NT 4.0 (service pack $\geqslant$ 6), Windows 2000 (service pack $\geqslant$ 1) and Windows XP.
It includes online help and is provided with a STB XCA 4002 cable to connect the NIM to the PC (length: 2 m).

Phaseo Regulated Power Supplies

ABL 7RE240●
ABL 7RP240●

ABL 7RE2405
ABL 7RP2405

ABL 7RE2410
ABL 7RP2410

ABL 7 power supplies

The ABL-7 range of power supplies is designed to provide the d.c. voltage necessary for the control circuits of automation system equipment. Split into three families, this range meets all the needs encountered in industrial, commercial and residential applications. Single-phase or 3-phase *(1)*, of the electronic switch mode type, they provide a quality of output which is suitable for the loads supplied and compatible with the mains supply available in the equipment. Clear guidelines are given on selecting protection devices which are often used with them, and thus a comprehensive solution is provided which can be used in total safety.

Phaseo switch mode power supplies

These switch mode power supplies are totally electronic and regulated. The use of electronics makes it possible to significantly improve the performance of these power supplies which offer:
■ compact size,
■ integrated overload, short-circuit, overvoltage and undervoltage protection,
■ a very wide range of permissible input voltages, without any adjustment,
■ a high degree of output voltage stability,
■ good performance,
■ LED indicators on the front panel.

Phaseo power supplies are available in single-phase and 3-phase versions *(1)*. They deliver a voltage which is precise to 3%, whatever the load and whatever the type of mains supply, within a range of 85 to 264 V for single-phase, or 360 to 550 V for 3-phase. Conforming to IEC standards, UL and CSA certified, they are suitable for universal use. The inclusion of overload and short-circuit protection makes downstream protection unnecessary if discrimination is not required.
ABL-7 RE and ABL-7 RP supplies are also equipped with an output undervoltage control which causes the product to trip if the output voltage drops below 19 V, in order to ensure that the voltage delivered is always usable by the actuators being supplied. All the products are fitted with an output voltage adjustment potentiometer in order to be able to compensate for any line voltage drops in installations with long cable runs. Most of our power supplies are designed for direct mounting on 35 and 75 mm ⊥ rails.

The 24 AC single-phase power supplies referenced in this ctalogue are quite adapted to tie-up with the Advantys STB modules (Network Interfaces Modules "NIM", Power Distribution Module "PDT" and inputs/outputs modules).

■ Universal single-phase supplies **ABL 7RE**:
□ power between 48 W (2 A) and 240 W (10 A),
□ compact size,
□ for all machine equipment,
□ suitable for use in automation system environments based on the Micro and Premium platforms or in any automation system configuration requiring a ⎓ 24 V supply.

■ Universal single-phase supplies **ABL 7RP**:
□ power between 60 W (2.5 A) and 240 W (10 A),
□ output voltage available : ⎓12, 24 and 48 V,
□ input filter (PFC) for commercial and residential environments (conforming to standard EN 61000-3-2),
□ two operating modes possible for handling of overload and short-circuit faults :
  - "AUTO" mode which provides automatic restarting of the power supply on elimination of the fault,
  - "MANU" mode which requires manual resetting of the power supply to restart. Resetting is achieved by switching off the mains power.

Advantys STB
Distributed I/O Solution
Phaseo Regulated Power Supplies

Using ⎓ 24 V

■ Using ⎓ 24 V enables so-called protection installations (PELV) to be built. Using PELV is a measure designed to protect people from direct and indirect contact. Measures relating to these installations are defined in publication NF C 12-201 and in standard IEC 364-4-41.

■ The application of these measures to the electrical equipment in machines is defined in standard NF EN 60204-1 and requires:
□ that the voltage used is below 60 V d.c. in dry environments and below 30 V in damp environments,
□ the connection of one side of the PELV circuit, or one point of the source, to the equipotential protection circuit associated with higher voltages.
□ the use of switchgear and control gear on which measures have been taken to ensure "safety separation" between power circuits and control circuits.

■ A safety separation is necessary between power circuits and control circuits in PELV circuits. Its aim is to warn of the appearance of dangerous voltages in ⎓ 24 V safety circuits.

■ The reference standards involved are:
□ IEC 61558-2-6 and EN 61558-2-6 (safety transformers),
□ IEC 664 (coordination of isolation).
Telemecanique power supplies meet these requirements.

■ Moreover, to ensure that these products will operate correctly in relation to the demands of their reinforced isolation, it is recommended that they be mounted and wired as indicated below:
□ they should be placed on an earthed mounting plate or rail,
□ they should be connected using flexible cables, with a maximum of two wires per connection, and tightened to the nominal torque,
□ conductors of the correct insulation class must be used.

■ If the d.c. circuit is not connected to an equipotential protection conductor, an earth leakage detector will indicate any accidental insulation faults (please consult your Regional Sales Office).

Operating voltage

■ The permissible tolerances for the operating voltage are listed in publications IEC 1131-2 and DIN 19240.

■ For nominal voltage Un = ⎓ 24 V, the extreme operating values are from - 15 % to + 20 % of Un, whatever the supply fluctuations in the range - 10 % to + 6 % (defined by standard IEC 38) and load variations in the range 0-100 % of In.

All Telemecanique ⎓ 24 V power supplies are designed to provide a voltage within this range.

■ It may be necessary to use a voltage measurement relay to detect when the normal voltage limits are being surpassed and to deal with the consequences of this (please consult your Regional Sales Office).

Selection of power supplies

The characteristics to be taken into account when selecting a power supply are:
■ the required output voltage and current,
■ the mains voltage available in the installation.
This may however result in several products being selected as suitable.
Other selection criteria must therefore be taken into account.

The quality of the mains power supply

The Phaseo range is the solution because it guarantees precision to 3% of the output voltage, whatever the load current and the input voltage. In addition, the wide input voltage range of Phaseo power supplies allows them to be connected to all mains supplies within the nominal range, without any adjustment.
The Phaseo RP family can also be connected to $=$ 110 and 220 V emergency supplies.

Harmonic pollution (power factor)

The current drawn by a power supply is not sinusoidal. This leads to the existence of harmonic currents which pollute the mains supply. European standard EN 61000-3-2 limits the harmonic currents produced by power supplies. This standard covers all devices between 75 W and 1000 W, drawing up to 16 A per phase, and connected directly to the public mains power supply. Devices connected downstream of a private, low voltage, general transformer are therefore excluded.

Regulated switch mode supplies always produce harmonic currents; a filter circuit (Power Factor Correction or PFC) must therefore be added to comply with standard EN 61000-3-2.
Phaseo ABL-7RP power supplies conform to standard EN 61000-3-2 and can therefore be connected directly to public mains power supplies.

Electromagnetic compatibility

Levels of conducted and radiated emissions are defined in standards EN 55011 and EN 55022.
All products in the Phaseo range have class B certification and can be used without any restrictions due to their low emissions.

Behaviour in the event of short-circuits

Phaseo power supplies are equipped with an electronic protection device. This protection device resets itself automatically on elimination of the fault (around 1 second for ABL-7RE/RP), which avoids having to take any action or change a fuse. In addition, the Phaseo ABL-7RP ranges allow the user to select the reset mode in the event of a fault:
■ in the "AUTO" position, resetting is automatic,
■ in the "MANU" position, resetting occurs after elimination of the fault and after switching the mains power off and back on.
This feature allows Phaseo ABL-7RP/U/REQ power supplies to be used in installations where the risks associated with untimely restarting are significant.

Selection of reset mode

It mades by microswitch on the front panel of the product.

Advantys STB
Distributed I/O Solution
Phaseo Regulated Power Supplies

Derating

The ambient temperature is a determining factor which limits the power that an electronic power supply can deliver continuously. If the temperature around the electronic components is too high, their life will be significantly reduced. Conversely, a power supply can deliver more than its nominal power if the ambient temperature remains largely below the rated operating temperature.
The rated ambient temperature for Phaseo power supplies is 50 °C. Above this, derating is necessary up to a maximum temperature of 60 °C.
The graph below shows the power P (in relation to the nominal power Pn) which the power supply can deliver continuously, according to the ambient temperature.
Derating should be considered in extreme operating conditions:
■ Intensive operation (output current permanently close to the nominal current, combined with a high ambient temperature).
■ Output voltage set above 24V (to compensate for line voltage drops, for example).
■ Parallel connection to increase the total power.

P/Pn (%)

Maximum operational temperature (°C)

General rules to be complied with	
Intensive operation	See derating on above graph. Example for ABL-7RE: □ without derating, from 0 °C to 50 °C, □ derating of nominal current by 2%, per additional °C, up to 60 °C.
Rise in output	The nominal power is fixed. Increasing the output voltage means that the current delivered must be reduced.
Parallel connection to increase the power	The total power is equal to the sum of the power of the power supplies used, but the maximum ambient temperature for operation is 50 °C. To improve heat dissipation, the power supplies must not be in contact with each other.

In all cases, there must be adequate convection round the products to ensure easier cooling. There must be a clear space of 50 mm above and below Phaseo power supplies and of 15 mm at the sides.

Association Phaseo Power supplies with STB modules

		Network interface module "NIM" STB N●●	Power distribution module "PDM" STB PDT 3100	
			Sensors	Actuators
Installation for Advantys STB with	1 power supply	**ABL 7RE2410/ABL 7RP2410** (10 A)		
	2 power supplies	**ABL 7RE2402** (2 A)	**ABL 7RE2410/ABL 7RP2410** (10 A)	
	3 power supplies	**ABL 7RE2402** (2 A)	**ABL 7RP2405/ABL 7RE 2405** (5 A)	**ABL 7RP2410/ABL 7R 2410** (10 A)

Note:
■ Network Interface module "NIM" STB N●●: ⎓ 24 V power supply, the input current is 0.4 A.
■ Power distribution module "PDM" STB PDT 3100: the max. current is:
□ for sensors: 4 A @ 30°C, 2.5 A @ 60°C,
□ for actuators: 8 A @ 30°C, 5A @ 60°C.
■ ABL 7RE power supply: built-in auto-protect with auto-reset
■ ABL 7RP power supply: built-in auto-protect with auto-reset or manu-reset. EN 61000-3-2 conforming.

Automation Product Certifications

Product certifications and marine classification authorities

In some countries, certification of certain electrical components is enforced by law. A standard conformity certificate is then issued by the official organization. Each certified product must carry approval symbols when enforced.

Use on board merchant navy vessels generally requires prior approval (= certification) of an electrical device by certain marine classification authorities.

Key	Certification body	Country
CSA	Canadian Standards Association	Canada
C-Tick	Australian Communication Authority	Australia
UL	Underwriters Laboratories	USA

Key	Classification authority	Country
ABS	American Bureau of Shipping	USA
BV	Bureau Veritas	France
DNV	Det Norske Veritas	Norway
GL	Germanischer Lloyd	Germany
GOST	Institut de recherche Scientifique Gost Standardt	C.I.S.
LR	Lloyd's Register	United-Kingdom
RINA	Registro Italiano Navale	Italy
RRS	Register of Shipping	C.I.S.

The table below shows the situation as of the 01.09.2003 for certifications obtained or pending from organizations for base PLCs. Further information regarding certified modules can be obtained from your Regional Sales Office.

Conformity to European Directives: CE marquing

All products are conformed to CE marquing.

The ⎓ 5 V required for the logic power supply of the I/O modules is provided by the modules:
☐ Network Interface NIM positionned at the beginning of the primary segment.
☐ BOS bus extension module positionned at the beginning of the extension segment.
This built-in 5 V power supply provides up to 1200 mA current.
Depending on the total number of modules (on the primary segment and the extension segments), the island installer ought to calculate the island's total power requirements to assure that the currrent required by the I/O modules is not greater than the current provided by the network interface module.

Using the worksheet
For each segment:
■ In the "Number" column, indicate the desired quantity for each of the I/O modules used.
■ In the "Total" column, calculate the total current based on that quantity.
■ In cell **1**, add up all these values (mA).
■ The total in cell **1** must be lesser than or equal to 1,200 mA, cell **2**.

Community regulations

European Directives

The opening of European markets implies a harmonization of regulations in the various European Union member states.

European Directives are documents used to remove obstacles to the free movement of goods and their application is compulsory in all states of the European Union. Member states are obliged to transcribe each Directive into their national legislation and, at the same time, to withdraw any conflicting regulations.

The Directives, particularly those of a technical nature with which we are concerned, only set objectives, called "general requirements".

The manufacturer must take all necessary measures to ensure that his products conform to the requirements of each Directive relating to his equipment.

As a general rule, the manufacturer affirms that his product conforms to the necessary requirements of the Directive(s) by applying the CE label to his product. CE marking is applied to Telemecanique products where relevant.

The significance of CE marking

● CE marking on a product means that the manufacturer certifies that his product conforms to the relevant European Directives ; it is necessary in order that a product which is subject to a Directive(s) can be marketed and freely moved within the European Union.

● CE marking is intended solely for the national authorities responsible for market regulation.

For electrical equipment, only conformity of the product to standards indicates that it is suitable for use, and only a guarantee by a recognised manufacturer can ensure a high level of quality.

One or more Directives, as appropriate, may apply to our products, in particular :

● The Low Voltage Directive 72/23/EEC amended by Directive 93/68/EEC : CE marking under the terms of this Directive could not be applied before 1 January 1995 and is compulsory as of 1 January 1997.

● The Electromagnetic Compatibility Directive 89/336/EEC, amended by Directives 92/31/EEC and 93/68/EEC : CE marking on the products covered by this Directive has been compulsory since 1 January 1996.

Protective treatment of equipment

Advantys, STB distributed I/O meet the requirements of "TC" treatment *(1)*.

For installations in industrial production workshops or in an environment which corresponds to "TH" treatment *(2)*, STB distributed I/O should be enclosed in casings with a minimum of IP 54 protection as prescribed by standards IEC.

Advantys, STB distributed I/O are supplied with an IP 20 protection index. They can therefore be installed without enclosure in locations with restricted access which do not exceed pollution degree 2 (control room which does not contain a machine or dust-producing activity).

(1) "TC" treatment : all climate treatment.
(2) "TH" treatment : treatment for hot and humid environments.
